Pig Feed Products

LNB SPECILAC The number 1 dairy ingredient for piglet's diets!

LNB Specilac is a natural lactose and high quality protein source and is the best additive to all diets for young pigs. The composition of Specilac makes the product very suitable for the first periods after birth.

Specilac contains all ingredients to give the piglets a good start. A quick growth in the nursery is very important, because it will lead to a short production cycle. Pigs that leave the nursery with one kg more body weight, can be taken to the market 6 days earlier!

Advantages of LNB Specilac:

- High, consistent & guaranteed quality
- Improves feed intake, through nice smell and appearance
- Easily digestible!
- Tailor made production possible
- Competitive price!
- Good mixing properties, like free flowing and non-caking

LNB Specilac has been thoroughly tested under practical conditions. Specilac is the most cost-effective dairy ingredient for piglet's diets, because:

- The use of quality ingredients
- The use of the most recent nutritional knowledge
- Our services and flexible organization

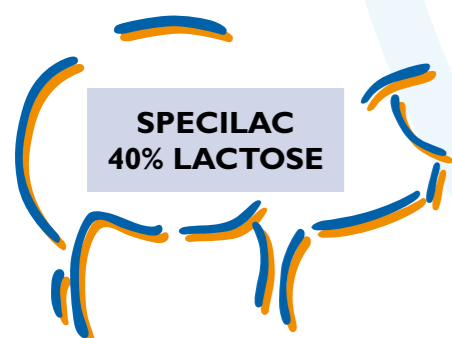

LNB Specilac is the best additive to all diets for young pigs

LNB International Feed B.V.
 Designer, producer and exporter of animal feed products

LNB Specilac - The economic must in all piglets' diets!

LNB's long-term experience with milk replacers has led to:

- Improved products and better results!
- Improved composition by using:
 - carefully selected protein sources
 - established dairy ingredients
- Maximum feed intake due to excellent taste.
- More value for your money.

LNB Specilac contains quality dairy ingredients which consist of :

- Whey powders
- Milk powders
- Lactose
- De-mineralized and de-salted whey powders
- Special products containing milk proteins

Average Nutrient values Skim Milk Powder:	
▶ Lactose:	49 %
▶ Fat:	1.50 %
▶ Protein:	34 %

Average Nutrient values Specilac:	
▶ Lactose:	17-40 %
▶ Fat:	1-20 %
▶ Protein:	25-38 %

A little physiology...

Just after birth, the piglet's digestive system is poorly developed for the digestion of the common feed ingredients.

The enzyme activity is low and is more suitable to digest and utilize milk components (fat, protein, lactose). Enzymes for the digestion of starch (amylase) and maltose (maltase) are absent and will be present only after a few weeks (Fig. 1).

On the other hand, the piglet has a well developed enzyme system for the digestion of milk ingredients.

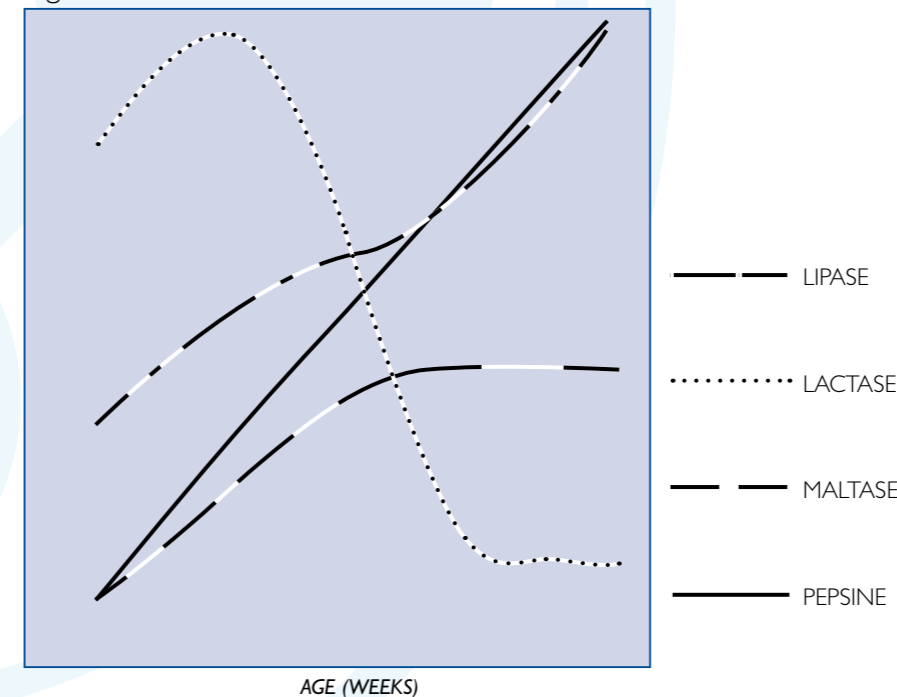

This is natural, since the very first feed a piglet gets is the mother's milk. Therefore, dairy

ingredients can also be digested easily by the piglets.

ENZYME ACTIVITY
